Task description

Build a simple tool (or structured script) to assist Sophie in manually labeling calcium traces. The tool should show each trace under **multiple smoothing conditions** and allow classification, with marked thresholds and peaks.

Sub-tasks

- ✓ ~~Load unlabeled calcium traces — data (its already labeled data to mix it up) add administration time~~
- ✓ Display traces with:
 - Standard deviation **threshold visualizations** to show what counts as a "real" event:
 - 1 SD threshold - baseline
 - 3 SD threshold - post activation
 - 20% max amplitude threshold

- $\Delta F/F = 0.2$ threshold
- Optional: highlighted peaks and suggested classifications
- ✓ Enable trace-labeling via dropdown/buttons with "Not sure" option
 - High flat, high oscillatory, oscillatory, low, drifting, not sure
- ✓ Store structured labels (filename, trace ID, label)
- ✓ Save output in model-training compatible format — talk to Ilya
- ✓ Document it → [Signal Processing Hub](#)

Optional improvements:

- Model-based class suggestions and confidence indicators - talk to Ilya
- Peak detection in smoothed traces: local maxima above 3 SD threshold

SD threshold vision:
